Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Customer Journey Map

The journey maps the ServiceNow user's experience stage-by-stage, including actions, touchpoints, thoughts, feelings, ownership and opportunities for improving secure record access.

Phase of Journey	**Stage 1** **Access Request**	**Stage 2** **ACL Evaluation**	**Stage 3** **Authorized Operation**
Actions *What does the customer do?*	• Logs in • Opens the Institution Details list • Requests to view a record	• ServiceNow evaluates roles • READ ACL checks bb1 • Branch value is checked	• Views permitted EEE record • Creates/edits/deletes when role permits • Receives access result
Touchpoint *What part of the service do they interact with?*	• Login • Application Navigator • Institution Details list	• ACL configuration • User roles • Branch field	• Record form/list • New/Edit/Delete actions • Access response
Customer Thought *What is the customer thinking?*	• “Can I access the records?” • “Where is the Institution Details table?”	• “Does my role allow this?” • “Is this record EEE?”	• “I should see only what I am authorized to use.” • “My permitted action should work.”
Customer Feeling *What is the customer feeling?*	Curious and cautious about access.	Concerned about authorization and data visibility.	Confident when access matches the assigned role; frustrated if unexpectedly denied.
Process Ownership *Who is in the lead on this?*	ServiceNow user / administrator	ServiceNow security administrator	ServiceNow ACL configuration and administrator
Opportunities *How can we improve this stage?*	• Clear navigation • Clear user/role setup • Simple test accounts	• Explicit ACL conditions • Separate roles for operations • Test with impersonation	• Consistent ACL behavior • Clear permission design • Document expected outcomes
