Performance Testing

Date	29 September 2026
Team ID	SWTID-2026-8067
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	5 Marks

Performance Testing

Performance testing for this project focuses on how the ServiceNow ACL solution behaves when users access the Institution Details table under expected and repeated access conditions. The uploaded template defines testing overview, test scenarios, performance results, observations and evidence sections. ■filecite■turn6file0■L7-L17■

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow instance / browser-based testing. No external load-testing tool is specified in the project content.
Type of Testing	Functional access-performance observation and repeated access testing; formal load/stress measurements are not provided.
Target Module / API	u_institution_details table — READ, CREATE, WRITE and DELETE ACL evaluation.
Test Environment	ServiceNow hosted instance / training environment.
Test Date	29 September 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Repeated READ access to EEE records using a bb1 user.	1	60	Authorized EEE records load successfully and unauthorized branch records remain inaccessible.
2	Repeated READ access using a user without bb1.	1	60	Access is denied consistently.
3	Repeated CRUD operations using users with bb1/bb2/bb3/bb4 roles.	1	120	Each operation is allowed only when the required role is present.
4	Repeated administrator access to the Institution Details table.	1	60	Administrator retains full access.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status	Remarks
1	Response Time (Avg)	< 2 seconds	Not measured	Pending	No performance measurement tool/result supplied.
2	Response Time (Max)	< 5 seconds	Not measured	Pending	Requires measured load-test data.
3	Throughput (Req/sec)	To be measured	Not measured	Pending	Requires performance testing tool.
4	Error Rate	< 1%	Not measured	Pending	Functional ACL verification is documented, but no load-test rate is supplied.
5	CPU Utilization	< 80%	Not measured	Pending	Requires server/environment monitoring data.
6	Memory Utilization	< 80%	Not measured	Pending	Requires server/environment monitoring data.

Step 4: Observations & Analysis

Key Findings	The project content demonstrates ACL access verification through user impersonation and operation checks. Formal performance measurements are not provided.
Bottlenecks Identified	No measured performance bottleneck is identified from the supplied project material.
Optimization Steps Taken	The READ ACL uses a short sequence of role and Branch checks, while CRUD permissions are separated into individual ACLs. No benchmark-based optimization is documented.

Step 5: Screenshots / Evidence

Performance testing evidence: No JMeter, Locust, k6 or equivalent performance screenshots were supplied with the project content.
Functional ACL evidence can be attached separately from the ServiceNow impersonation/list/form verification steps.
